About Me

A full-stack developer with a five-year foundation in end-to-end engineering, specializing in Go (Golang) backends and Next.js frontends. My core strength lies in architectural ownership across the entire application lifecycle, from complex database schema design to modern frontend delivery. I have engineered high-volume internal API gateways that prevented legacy system bottlenecks and optimized PostgreSQL queries to cut data response times by up to 40% for over 5,000 active users. Beyond application code, I actively manage modern deployment infrastructure using Docker and have engineered low-latency transaction processing engines for retail clients. Driven by a commitment to continuous optimization and secure, scalable design, I am eager to bring robust infrastructure and intuitive user experiences to a forward-thinking engineering team.

Education

RevoU

January, 2024 – May, 2024

Full Stack Data Analytics

Intensive program in Python, SQL, Excel, and Tableau

Final Grade : 90.91

Capstone : Exploratory Analysis of 375K+ Kickstarter Campaigns with Tableau Dashboard

STIKI MALANG

August, 2016 – December, 2023

Bachelor of Informatics Engineering

Thesis : Rancang Bangun Aplikasi Travel Berbasis Android

Working Experiences

Web Developer, Universitas PGRI Adi Buana Surabaya

August, 2023 – Present

- Automated Data Integration Pipelines (PDDIKTI): Designed and engineered a dedicated integration layer (Neo Feeder Importer) to handle two-way data synchronization with the official government PDDIKTI Feeder API, reducing manual data entry workloads for academic staff by 90%.
- End-to-End Data Synchronization (SISTER): Developed backend integration infrastructure to automate the secure, cross-platform synchronization of large-scale institutional assets and lecturer profiles, maintaining full data compliance with national higher education standards via the SISTER Kemdiktisaintek API.
- Real-Time Data Communication Tracking (Qontak): Architected a high-volume notification engine integrated with the enterprise Qontak WhatsApp Business API, automating institutional broadcasting workflows and establishing structured tracking pipelines for real-time delivery data.
- Database Optimization & Query Tuning: Implemented strategic database indexing and optimized complex SQL queries in PostgreSQL, cutting average system data response times by up to 40% for high-volume academic platforms.

Software Developer, Strugg House

November, 2019 – Present

- Data Infrastructure & Low-Latency Processing: Self-taught and successfully deployed low-latency Point of Sale (POS) transaction processing engines using Go (Golang), ensuring rapid data ingestion and high-integrity handling of high-volume retail client transaction data.
- Operational Reporting & Dashboards: Partnered with corporate clients to coordinate the end-to-end delivery of custom client management portals, engineering internal operational backend services and Next.js frontends to handle purchasing data pipelines and internal analytical dashboards.
- Agile Delivery Optimization: Implemented streamlined agile development methodologies and modern AI-assisted engineering workflows across client projects, resulting in a 25% reduction in project completion time and faster iterative prototyping.

Project Experiences

NFI (Neo Feeder Importer) – API PDDIKTI Integration, Adi Buana

January, 2024 – May, 2024

- Developed Neo Feeder Importer (NFI), a specialized data integration layer designed to establish direct, two-way data synchronization with the official PDDIKTI Neo Feeder API.
- Eliminated the manual, error-prone workflow of exporting and importing data files through the government portal, reducing manual data entry by 90% for academic staff.
- Gained deep practical experience in managing complex data schema mappings and external API error handling, ensuring seamless government compliance reporting.

- SISTER Synchronization – API SISTER Kemdiktisaintek Integration, Adi Buana****May, 2024 – October, 2024**
- Engineered a dedicated backend integration module to establish direct API connectivity between the internal university database and the official Kemdiktisaintek SISTER portal.
 - Automated the secure synchronization of critical institutional data, including lecturer profiles, academic portfolios, and operational resources, eliminating manual portal updates.
 - Mastered complex external data schema mappings and token-based authentication protocols, ensuring seamless compliance with national higher education data standards.

- Unipasby-Services (v1 to v2) – Internal University API Gateway, Adi Buana****Sept, 2025 – May, 2026**
- Developed and evolved the university's core internal API layer using Go (Golang), transitioning from an initial experimental framework (v1) to a streamlined production gateway (v2).
 - Successfully offloaded heavy data query bottlenecks from the legacy system, preventing the institutional ERP from collapsing under high-volume academic requests.

- Integrated Academic Platforms - Nextjs Ecosystem Frontends, Adi Buana****August, 2024 – May, 2026**
- Engineered and maintained the modern web user interfaces for critical campus platforms, including Student Hub, SI OBE, Keuakad Blast, and SIREWARD, utilizing Nextjs.
 - Architected the WhatsApp notification engine with Keuakad Blast, successfully integrating the enterprise Qontak API to automate high-volume institutional broadcasting and real-time communication tracking.
 - Collaborated closely across the full stack by actively developing and extending backend API endpoints whenever new frontend features or data schemas required support.

Additional Information

Technical & Soft Skills: SQL (PostgreSQL, MySQL), Python, Tableau, Excel, Data Visualization, Data Cleaning, Golang, Nextjs, Laravel, Problem Solving, Attention to Detail, Cross-functional Collaboration.

Certification:	1. TOEIC (score: 920), International Test Center	27/08/2020
	2. Web Developer Level VI , Professional Certification Board of STIKI MALANG	05/10/2020
	3. Certificate of Achievement , RevoU Data Analytics Bootcamp	04/05/2024
